## 7. Parameter Estimation

- Measuring parameters of a source is essential for astrophysics with gravitational wave detections.
- With GW detectors we can measure the chirp mass, spin, eccentricity, distance, and sky position.
- Chirp mass is given by  $\mathcal{M} = (m_1 m_2)^{3/5} / (m_1 + m_2)^{1/5}$

## 8. Astrophysics with Source Parameters

- Constrain the mass distribution of black hole binaries.
- Distinguish between different black hole formation channels.
- Attempt to constrain parameters in binary evolution using population synthesis models.
- Measure the evolution of merger rate / mass distribution with redshift.

ъ

## 9. Bayesian Model Selection

Bayes Theorem:

$$p(M|D, I) = \frac{p(D|M, I) \times p(M|I)}{p(D|I)}$$

 Compute Bayes Factors for two competing models, M<sub>S</sub> and M<sub>N</sub>, to find the correct model

$$B_{S,N} = \frac{p(D|M_S)}{p(D|M_N)}$$

log Bayes factor for comparing a signal model and noise only model is then

$$log(B_{S,N}) = log[p(D|M_S)] - log[p(D|M_N)]$$

Compare two signal models S<sub>i</sub> and S<sub>j</sub> by computing

$$log(B_{S_i,S_j}) = log(B_{S_i,N}) - log(B_{S_j,N})$$

### **10.** Parameter Estimation

 To calculate the evidence for each model we integrate the likelihood multiplied by the prior over all possible parameter values θ

$$p(D|M) = \int_{\theta} p(\theta|M) p(D|\theta, M) d\theta.$$
(1)

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- The evidence integral is difficult for a large number of parameters.
- This problem is solved using nested sampling.

## 11. Nested Sampling

- First the likelihood is calculated for selected points distributed over the entire prior.
- The point with the smallest likelihood and largest prior mass is selected and becomes the limiting values.
- A new point is generated inside the new limits.
- This is repeated so that it iterates inwards in prior mass and upwards in likelihood until the highest value is found.
- Produces Bayes factors and posterior distributions on the signal parameters.

### 12. Burst Sources

- For a burst source we don't know exactly what a signal should look like.
- We use sine Gaussian's as a signal model.
- They are defined as,

$$h_x(t) = h_0 \sin(2\pi f t) \exp(-t^2/\tau^2)$$
 (2)

$$h_{+}(t) = h_0 \cos(2\pi f t) \exp(-t^2/\tau^2)$$
 (3)

- where  $\tau = Q/\sqrt{2}\pi f$ , f is the frequency, Q is the quality factor, t is time of the signal and  $h_0 = hrss/\sqrt{\tau}$ , where hrss is the root sum squared amplitude of the signal.
- Produces posterior distributions on hrss, Q, f, and sky position.

## 13. Glitches

- Glitches are short duration excess power noise created by the detector or the environment.
- The detectors have 1000's of auxiliary channels of data from monitors around the detector.
- Some glitches don't show up in any monitors making it difficult to determine their origin.
- They limit the sensitivity of gravitational wave searches.

◆□▶ ◆圖▶ ◆臣▶ ◆臣▶ ─ 臣

## 14. Signals with glitches

- 10<sup>6</sup> glitches above SNR 6 were observed in 51.5 days of O1.
- GW170817 had a large glitch in L1.
- High probability that as detections increase, more will occur at the same time as a glitch.

э

## 15. Glitch Removal

- For GW170817 we already know what we expected the signal to look like.
- The glitch was very loud and easy to identify as being a glitch.
- It was removed by gating and subtracting the reconstructed waveform.
- The glitch is short duration compared to the signal, which means some signal is still left over after gating.
- It might not be so easy next time!

(日)、

## 16. This Analysis

- We inject three different types of gravitational wave signals on top of three different types of glitches.
- We measure the parameters of the signals at different signal to noise ratios and offsets in time between the signal and glitches.
- What happens if the glitch is not obvious because it does not occur in auxiliary channels and the exact shape of the signal waveform is unknown?
- We determine the effects of glitches that can't be gated.
- We investigate if the effects of glitches is worse when there is a mis-match between signal and template.

## 17. The Glitches

Three types of O1 glitches are used that occur in L1 at the same time as good quality H1 data.

Figure: Images taken from Gravity Spy.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

## 18. The Signals

- We measure parameters of all signals injected near glitches with time offsets of 0.0 s, 0.1 s and 0.2 s.
- IMRPhenomPv2 signal model is used for the CBC signals.
- A sine Gaussian signal model is used for the sine Gaussian signals.
- A sine Gaussian model is used for the supernova signals to determine if effects are worse when there is a mis-match between signal and model.

## 31. What's next?

- Next step is to apply techniques designed to reduce the effect of glitches to the data set.
- We are attempting to reconstruct the glitch and the signal at the same time to reduce the error on signal parameters.
- Currently Bayes factors can be produced to tell you if their is a signal or a glitch in the data.
- Next we hope to produce a Bayes factor that tells you there is both a signal and a glitch.
